

Unity® and LAMP Words for Life™ – Choosing a device

Language Acquisition through Motor Planning (LAMP) is a therapeutic approach based on neurological and motor learning principles. LAMP therapy focuses on giving the individual independent access to vocabulary on voice output AAC devices that use consistent motor plans for accessing vocabulary. Vocabulary targets are selected collaboratively with the family, based on the individual's interests and desires. Multisensory input including consistent movement, vision and auditory feedback with natural consequences in their normal environment occurs to maximise language acquisition.

The LAMP approach was first developed by utilising motor learning principles along with the **Unity®** language system. The **LAMP Words for Life™** language system was developed to combine the power of Unity with the LAMP principles and strategies. Both language systems strictly utilise the principles of motor planning and can be used in conjunction with the LAMP approach.

Liberator offers several devices with Unity® and/or LAMP Words for Life™. All Liberator dedicated devices are available for a free 3 week trial with support from our consultants. The LAMP Words for Life™ app is available through the App store.
